DETAILED ACTION

Response to Arguments

Applicant's arguments filed July 14, 2005 have been found convincing. The rejections have the previous Office Action have been withdrawn.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-18 and 28-43 are rejected under 35 U.S.C. 103(a) as being unpatentable over the applicant's admitted prior art ^{in view of} Brabant et al. (US 2003/0036268). Thur 10/31/05

The applicant admits that ALD processes are known in forming films of hafnium dioxide or aluminum oxide, wherein the first reactant is a metal halide and the second reactant is oxygen or ozone. It is also explicitly taught that it is known that undesirable substrate oxides result when chemisorption of the first reactant is incomplete (page 4, lines 1-10). What is taught to be unknown is removing undesirable substrate oxides by flowing gaseous HF into the chamber. However, Brabant teaches that removing substrate oxides by flowing HF over the substrate increases purity in an ALD process [0011] and [0028]. Therefore, it would have been obvious at the time the invention was made to a person having ordinary skill in the art to utilize the HF flow as a step in at

least some of the ALD cycles. By doing so, one would reap the benefits of removing the undesirable substrate oxides that form during the oxidation step.

As to the dependent claims, non-uniform chemisorption over a silicon substate would inherently result in silicon dioxide being the surface oxide. The "at least some of the ALD cycles" reads on not using it some cycles. Claims 16-18 claim inherent properties of the first reactant.
